**Annotation:** It is necessary to form a culture of course in various fakes that are developing today and the same is the main product of mastery for the development of intellectual culture, intellectual fakes. The educational background of young people can be the basis of sphere.

**Keywords:** healthy extrirases, creative abilities, technical progress, society, integration, national spiritual, national intellectual, intelligence of immunity.

The demand for the development of science and technology, which is developing in the world at the level of a new qualitative stage, is growing. It should be said that within the framework of this requirement, it is necessary to further accelerate reforms related to the promotion of human thinking and, through this, first of all, to form healthy extrirases in young people. The fact is that any development arises from dissatisfaction with the existing state. That is, satisfaction with the current state causes stagnation. Dressing a new need in a person is a source of progress. In the current developing period, intelligent, creative, inquisitive and independent thinking youth is a huge force that drives the scientific technical progress of society, which in the future will need to integrate all spheres with the world community (development of cooperation). In this regard, the approach to the problem is desirable to look for talented young people, give them reasonable guidance and put them in the direction. Because the individual characteristics inherent in any of them, internal strength, opening up, improving, developing hidden opportunities, finding influencing factors and means, that is, in accordance with the demand of their community needs and the possibility of development, in a word, increasing the innovative activity of young people is a requirement of the current period.

Of course, we are delighted with the changes in the field of education in Uzbekistan, the activities of various foundations, the choice of talents. But this yet is not enough. "On education President of the Republic of Uzbekistan I.A.Karimov its content can be expressed succinctly: We need not graduates, but individuals who have seen school education and upbringing. The truth is that knowledge must be acquired, but independent thinking and contemplation in an unconventional way can lead to further development and social progress.

Of practical importance in the development and strengthening of national spiritual immunity will be the creation and effective use of the following factors. First of all, the development and effective use of national intellectual potential. To do this, it is necessary to develop education and national education, to make national traditions and values an integral part of the youth worldview, to make young people feel that the values of their nation, no matter how high they are rich, beautiful and comprehensively modern and superior, and to be considered as the main source of enriching their spirituality. In the implementation of such goals, the law "On education", the "National program for Personnel Training" will play an important role. Secondly, a new

model of education leads to the formation in society of an independent thinking free personality. We will have the opportunity to educate people whose will is energetic, whose faith is whole, with a clear goal in life, who realize their self-esteem. It is then that conscious marriage becomes the main criterion for the life of society. An important feature of community intelligence, in our opinion, is that this layer organizes, develops and complements itself in an individual way. That is, intelligence develops all the necessary tools and paths for its activities on its own and provides improvement in accordance with its time.

In the current period of global development, the social consciousness and worldview of people are constantly updated and its edges are expanding more and more. Including a new way of scientific thinking has been formed, under the influence of which unconventional ideas, thoughts are emerging. As a consequence of these processes, tools are emerging that develop the intellectual culture of the individual and society. For example, these are positive innovations in scientific and technical, literature and art and teaching methods.

Taking into account the fact that civil society, which is being formed in our country, is improving precisely through these changes, it requires us to educate the youth of today as intellectually cultured in perspective. To do this, it remains an important necessity for individuals of a high intellectual culture belonging to the older generation to diligently make cocktails, carefully approach the solution of existing problems in society and bring a bright future to the ground. So in this regard, they must first overcome a number of problems that are hindering the development of our society in order to educate young people with similar potential.

That is, first of all, to finish off the old-fashioned sarcophagi from the consciousness and thinking of the older generation, to some extent, to pay more attention to the spiritual and moral education of young people, to develop methods and means of overcoming the old, managerial system habits and reforms by raising active youth who are in favor of significant changes in the, in ensuring the implementation of decisions and decrees, it is necessary to give a declarative form or end the circumstances of moving away from practice, to raise the legal consciousness of society, to eliminate existing shortcomings in this regard, to form a competitive environment in the education system, adhering to state educational standards in mastering the development of modern science and technology. Therefore, it is important to create modern networks that allow us to bring out competitive products in the world market, which are necessary for our country through science and technology, and to create conditions for young personnel ensuring the development of science to be aware of the experience of developed countries, to improve the social infrastructure and household services. It is necessary to eliminate existing shortcomings in bringing the idea of national independence closer to the people's psyche, to prevent the sphere of science from becoming dependent on other spheres, to prevent existing obstacles facing employees serving in the field of science: such vices as paperism, command and repair, to give adequate attention to the development of science, freedom and solve such as you know, all knowledge and technology change and improve with the passage of time. And on the basis of this process, new professions and industries are emerging in the labor market. Therefore, we need to form and develop the intellectual potential of the individual and society in such a way that it comes from the demands of today's global labor market. In this regard, we will improve all the factors that increase intellectual potential in accordance with these requirements.

In general, large-scale clearly oriented measures are being implemented in our country to educate a healthy and harmonious generation, to realize the creative and intellectual-innovative potential of young people, to create the necessary conditions and opportunities to bring up young men and girls of our country as comprehensively developed individuals who fully meet the requirements of the 21st century.

So, all of the above factors, considered as tools for the development and further promotion of the intellectual potential of young people in increasing their innovative activity, are constantly changing and improving, all of them arise and prosper on the principle of succession of community intelligence.
